

- In this lab, we learnt about basics of interface designing and ways to do it. We got to know about the importance of interface designing and how it becomes so much important when a human wants to interact with the machine.
- Definitely YES. This lab course taught us how to conceptualize and visualize your actual product before it goes into development. It also helps us to point out mistakes (if any) in our design when we visualize it.
- The relevance of the stated step is to understand the requirements of users and the problems that they are facing. This would help us to design our product better and more aligned towards the users. It also allows us to rectify some of our mistakes in the interface and product design before sending the product in development stage.
- From this course, we learnt two skills which would be very helpful in our future projects. One is interface designing and second is how to take interviews and understand the needs of the users. In our future products, we will first consider talking to users to understand their needs and then design the interface accordingly. We can also have a dry run on the designed interface which will help us to rectify our mistakes in early development stage.
- For entrepreneurs, most important thing is to understand the needs of customers and design their product accordingly. For some of them, interface designing may not be helpful (May be they are not going to deliver a software or hardware product but some services) but the skill to conduct interviews and taking feedback will help them to succeed in their project.
- One of the most important job or responsibility of a product manager is to understand the needs of the customers and align stakeholders around the vision of the product. Therefore, the skills that we learnt in this course are the building blocks which will be useful to a product manager to design their product in a robust manner and visualize them in a correct manner.
- If I take up a developer's job in Google, interface designing will help me to visualize my product and rectify some of my mistakes in the early stage. It will save a lot of development cost and thus increase the productivity. The conducted interviews will help us to rectify our mistakes which later on reduce the cost we put on for customer care.
